# CONVERSION FACTORS, ACRONYMS, SYMBOLS, DEFINITIONS OF UNITS, AND VERTICAL DATUM

## Conversion Factors

<u>Multiply</u>	<u>by</u>	<u>to obtain</u>
mile (mi)	1.609	kilometer
square mile (mi <sup>2</sup> )	2.590	square kilometer
cubic foot per second (ft <sup>3</sup> /s)	0.02832	cubic meter per second
tritium units (TU)	3.2	picocuries per liter

Temperature in degrees Fahrenheit ( $^{\circ}$  F) can be converted to degrees Celcius

$$^{\circ}\text{C} = 5/9 (^{\circ}\text{F} - 32)$$

## Acronyms and Symbols

BOD	Biochemical Oxygen Demand, 5-day
CaCO <sub>3</sub>	Calcium Carbonate
CFC-11	Ochlorofluorocarbon-11
CFC-12	Chlorofluorocarbon-12
CFC-113	Chlorofluorocarbon-113
EPD	Georgia Department of Natural Resources Environmental Protection Division
H-2/H-1	Hydrogen Isotopic Ratio
MPN	Most Probable Number
NTU	Nephelometric Turbidity Unit
O-18/O-16	Oxygen Isotopic Ratio
SiO <sub>2</sub>	Silicon Dioxide
TU	Tritium Unit
USGS	U.S. Geological Survey

## Definition of Units

deg. C	Degrees Celcius
ft <sup>3</sup> /s	cubic foot per second
mi <sup>2</sup>	square mile
mg/L	Milligrams per liter
per mil	Parts per thousand
pg/kg	Picogram per kilogram
piC/L	Picocuries per liter (1 TU equals 3.2 piC/L)
ug/L	Micrograms per liter
uS/cm	Microsiemens per centimeter

## Vertical Datum

*Sea level:* In this report "sea level" refers to the National Geodetic Vertical Datum of 1929--a geodetic datum derived from a general adjustment of the first-order level nets of the United States and Canada, formerly called "Sea Level Datum of 1929".

# **WATER-RESOURCES DATA FOR THE VALDOSTA AREA, SOUTH-CENTRAL GEORGIA, 1961-93**

by

James B. McConnell, Eurybiades Busenburg, and L. Niel Plummer

## **ABSTRACT**

The Upper Floridan aquifer is the sole source of water supply for the city of Valdosta, Ga., and much of the surrounding area. Users and water-resources managers and developers are concerned about the quality of water in the aquifer. The water quality of a large part of the Upper Floridan aquifer in the Valdosta area is affected by direct recharge of water from the Withlacoochee River to the aquifer through sinkholes in the river channel north of Valdosta. Furthermore, because the Withlacoochee River receives little filtration as it recharges the aquifer in this area, ground water might be vulnerable to contamination as a result of human activities within the Withlacoochee River basin.

Stream-discharge and water-quality data from 17 surface-water sites and ground-water-quality data from 111 wells in the vicinity of Valdosta, Ga., are presented for the period 1961-93. Also, ground-water-level data for the Upper Floridan aquifer in the Valdosta area are presented in a series of potentiometric-surface maps. The water-resources data were collected mostly in Lowndes County in the vicinity of Valdosta and lesser amounts were collected in surrounding Berrien, Brooks, Cook, Echols, and Lanier Counties.

## **INTRODUCTION**

The Upper Floridan aquifer is the sole source of water supply for the city of Valdosta, Ga., and much of the surrounding area. The aquifer yields an ample supply of water; however, there are concerns by users and water-resources managers and developers about the quality of water in the aquifer. The water quality of a large part of the Upper Floridan aquifer in the Valdosta area is affected by direct recharge of water from the Withlacoochee River to the Upper Floridan aquifer through sinkholes in the river channel north of Valdosta. Furthermore, because the Withlacoochee River receives little filtration as it recharges the aquifer in this area, ground water in the Valdosta area might be vulnerable to contamination as a result of human activities within the Withlacoochee River basin.

Concern about the quality and quantity of ground water in the Valdosta area has resulted in several water-resources investigations conducted during the period 1974 to 1993 by the U.S. Geological Survey (USGS) in cooperation with other Federal, State and local agencies. In cooperative studies with the city of Valdosta, Krause (1976) reported on the occurrence and distribution of ground water affected by recharge of water from the Withlacoochee River. McConnell and Hacke (1993) reported on the hydrogeology, water quality, and water-resources development potential in the Valdosta area. Currently (1990-94), the USGS, in cooperation with the city of Valdosta, is conducting an investigation to age-date ground water in the Valdosta area using chlorofluoro-carbons and other tracers of ground-water flow. In yet another cooperative study between the USGS and the Georgia Department of Natural Resources, Environmental Protection Division (EPD), Georgia Geologic Survey, Krause (1979) reported on the geohydrology of Brooks, Lowndes, and Echols Counties in the vicinity of Valdosta, Ga.

In addition to these cooperative investigations, the USGS is conducting ongoing cooperative statewide data-collection programs which includes Valdosta and the surrounding area. Water-quality and stream-discharge data are collected monthly at a site on the Withlacoochee River above Valdosta as part of an ongoing water-quality, trend-monitoring program with EPD, Water Protection Branch. Stream discharge of the Withlacoochee River above Valdosta and ground-water levels in a shallow aquifer and in several wells open to the Upper Floridan aquifer are continuously monitored as part of a data-collection program with the city of Valdosta. Water-quality and stream-discharge data (Stokes and McFarlane, 1994) and ground-water-level data for sites in the Valdosta area (Joiner and Cressler, 1994) are published annually in USGS water-resources data and ground-water conditions reports for Georgia. Additional information can be obtained from the District Chief, USGS, Peachtree Business Center, 3039 Amwiler Road, Suite 130, Atlanta, GA 30360-2824.

The cooperative studies and data-collection programs have produced a vast amount of water-quality, stream-discharge, and water-level data. Part of the data currently appears in basic-data reports and in interpretive reports. Generally, the interpretive reports do not report all data that were collected as a part of a study. Thus, compiling and documenting the data in a single publication will provide a useful water-resources reference for the Valdosta area.

### Purpose and Scope

This report presents water-quality, stream-discharge, and ground-water-level data collected by the USGS from August 1961 to September 1993 in Lowndes and surrounding counties (fig. 1). Most of the data presented were collected in Lowndes County in the vicinity of the city of Valdosta and a lesser amount of data were collected in adjacent Berrien, Brooks, Cook, Echols, and Lanier Counties. The frequency of data collection and the types of water-quality analysis were substantially greater from 1988-93 than during previous years because of water-resources investigations conducted in cooperation with the city of Valdosta during that period.

### Surface-Water Site and Well-Numbering System

Surface-water sites were assigned a three-character site reference number that identifies the sites on the study-area map. The sites also may have a station number listed in the data tables. The station number is a unique number that is assigned to surface-water stations according to downstream order. For example, the station number 02317749 (Withlacoochee River above Valdosta, Ga.), includes a two-digit part number "02", plus the downstream order number "317749".

Wells are numbered by a system based on USGS 7 1/2-minute quadrangle topographic maps. Each 7 1/2-minute map in Georgia has been given a number and letter designation beginning at the southwestern corner of the State. Numbers increase eastward through 39 and letters increase alphabetically northward through "Z", then become double-letter designations "AA" through "PP". The letters "I", "O", "II", and "OO" are not used. Wells inventoried in each quadrangle are numbered sequentially beginning with "1".

## DATA COLLECTION AND PRESENTATION

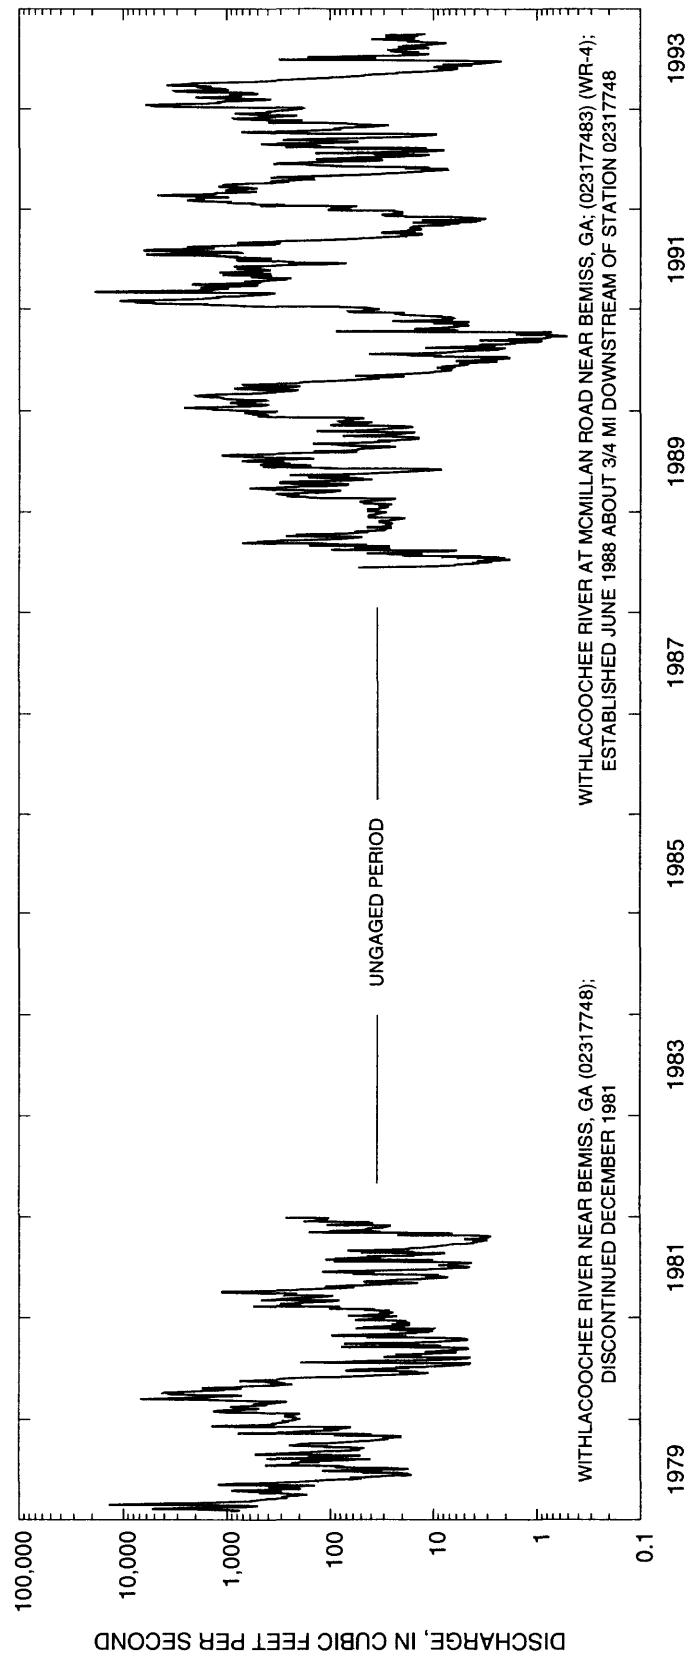

Data presented in this report were collected at 17 surface-water sites (2 lake and 15 stream sites) and 111 wells from 1961 through September 1993 (plate 1). Most of the water-quality data were collected in cooperation with the city of Valdosta; however, some water-quality and stream-discharge data for the Withlacoochee River above Valdosta (site number WR-5; station number 02317749) were collected in cooperation with EPD. Laboratory analyses of water samples were provided by both the USGS National Water-Quality Laboratory and EPD Water-Quality Laboratory. Analyses of water samples for chemical, isotopic, and dissolved gases concentrations, including chlorofluorocarbons collected from June 1988 through October 1993, were provided by L. Niel Plummer and Eurybiades Busenberg, USGS, Reston, Va.

Surface- and ground-water data are separated into tables of surface water (tables 1-5) and ground water (tables 7-13), grouped by data type, and arranged by sampling site and date. The period of data collection in the tables may be either for the entire period-of-record or for shorter periods of time associated with specific water-resources investigations. The reporting level of water-quality properties or constituent concentrations may vary during the period of data collection because of different analytical methodology used.

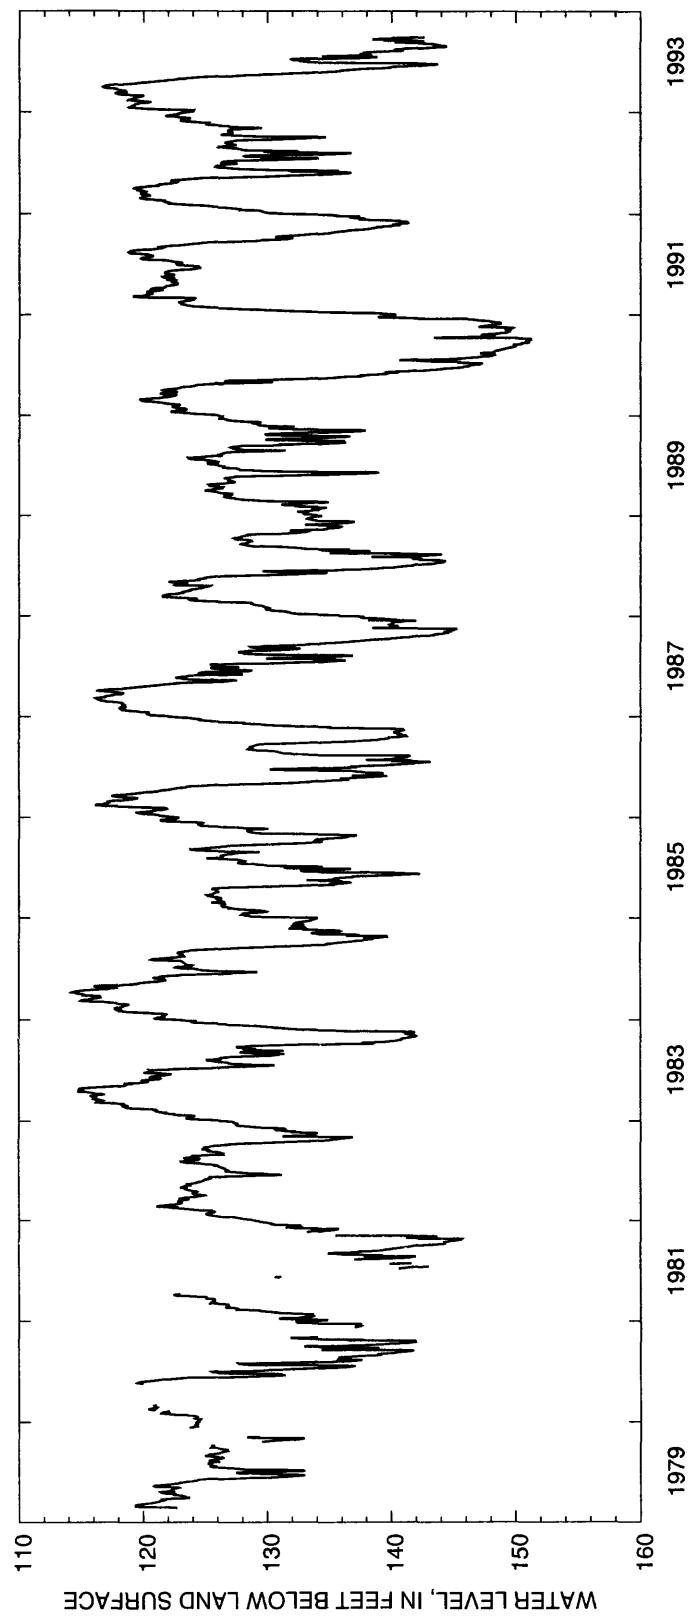

Basic records for long-term monitoring of stream-discharge and water-quality for the Withlacoochee River above Valdosta (Stokes and McFarlane, 1994) and ground-water-level data for the Upper Floridan aquifer (Joiner and Cressler, 1994) are not included in this report. However, stream-discharge and water-quality data for the Withlacoochee River above the sinkhole area are represented by a statistical summary of discharge and water-quality data for Withlacoochee River above Valdosta (WR-5) (table 6). Seasonal variation in stream discharge of the Withlacoochee River and water levels of the Upper Floridan aquifer are represented by graphs of long-term discharge for the Withlacoochee River at McMillan Road near Bemiss (WR-4) (fig. 2) and long-term water levels for well 19E039 (fig. 3). Seasonal variations in the potentiometric surface of the Upper Floridan aquifer are shown in figures 4 to 9 (Burgoon, 1991; Cressler, 1993; McConnell, 1993; and Peck, 1991).
